

NDA 21-141 WELCHOL™ CAPSULES PACKAGE INSERT

Welchol™ Capsules
(colesevelam hydrochloride)
[koe le sev´ e lam]
Rx only

DESCRIPTION

Welchol™ contains colesevelam hydrochloride (hereafter referred to as colesevelam), a non-absorbed, polymeric, lipid-lowering agent intended for oral administration. Colesevelam is a high capacity bile acid binding molecule. Colesevelam is poly(allylamine hydrochloride) cross-linked with epichlorohydrin and alkylated with 1-bromodecane and (6-bromohexyl)-trimethylammonium bromide. Colesevelam is hydrophilic, and insoluble in water.

Welchol™ is a white, opaque, hard-gelatin capsule containing 375 mg colesevelam and 1% magnesium stearate. The capsules are imprinted using a water-soluble blue ink.

CLINICAL PHARMACOLOGY

Mechanism of Action

The mechanism of action for the lipid-lowering activity of colesevelam, the active pharmaceutical ingredient in Welchol™, has been evaluated in various *in vitro* and *in vivo* studies. These studies have demonstrated that colesevelam binds bile acids, including glycocholic acid, the major bile acid in humans.

Cholesterol is the sole precursor of bile acids. During normal digestion, bile acids are secreted into the intestine. A major portion of bile acids are then absorbed from the intestinal tract and returned to the liver via the enterohepatic circulation.

Colesevelam is a non-absorbed, lipid-lowering polymer that binds bile acids in the intestine, impeding their reabsorption. As the bile acid pool becomes depleted, the hepatic enzyme, cholesterol 7- α -hydroxylase, is upregulated, which increases the conversion of cholesterol to bile acids. This causes an increased demand for cholesterol in the liver cells, resulting in the dual effect of increasing transcription and activity of the cholesterol biosynthetic enzyme, hydroxymethyl-glutaryl-coenzyme A (HMG-CoA) reductase, and increasing the number of hepatic low-density lipoprotein (LDL) receptors. These compensatory effects result in increased clearance of LDL cholesterol (LDL-C) from the blood, resulting in decreased serum LDL-C levels.^{1, 2}

Clinical studies have demonstrated that elevated levels of total cholesterol (total-C), LDL-C, and apolipoprotein B (Apo B, a protein associated with LDL-C) are associated with an increased risk of atherosclerosis in humans. Similarly, decreased levels of high-

density lipoprotein cholesterol (HDL-C) are associated with the development of atherosclerosis¹. Epidemiological investigations have established that cardiovascular morbidity and mortality vary directly with the levels of total-C and LDL-C, and inversely with the level of HDL-C.

The combination of colessevelam and an HMG-CoA reductase inhibitor is effective in further lowering serum total-C and LDL-C levels beyond that achieved by either agent alone. The effects of colessevelam either alone or with an HMG-CoA reductase inhibitor on cardiovascular morbidity and mortality have not been determined.

Pharmacokinetics

Colesevelam is a hydrophilic, water-insoluble polymer that is not hydrolyzed by digestive enzymes and is not absorbed. In 16 healthy volunteers, an average of 0.05% of a single ¹⁴C-labeled colessevelam dose was excreted in the urine when given following 28 days of chronic dosing of 1.9 grams of colessevelam twice per day.

Clinical Trials

Welchol™ reduces total-C, LDL-C, and Apo B, and increases HDL-C when administered either alone or in combination with an HMG-CoA reductase inhibitor in patients with primary hypercholesterolemia.

Approximately 1400 patients were studied in eight clinical trials with treatment durations ranging from 4 to 50 weeks. With the exception of one long-term study, all studies were multicenter, randomized, double-blind, and placebo-controlled. A maximum therapeutic response to Welchol™ was achieved within 2 weeks and was maintained during long-term therapy.

In a study in patients with LDL-C between 130 and 220 mg/dL (mean 158 mg/dL), Welchol™ was given for 24 weeks in divided doses with the morning and evening meals. As shown in Table 1 below, the mean LDL-C reductions were 15% and 18% at the 3.8 g and 4.5 g doses. The respective mean total-C reductions were 7% and 10%. The mean Apo B reductions were 12% in both treatment groups. Welchol™ at both doses increased HDL-C by 3%. There were small increases in triglycerides (TG) at both Welchol™ doses that were not statistically different from placebo.

Table 1: Welchol™ 24 Week Trial - Percentage Change in Lipid Parameters From Baseline

GRAMS/DAY	N	LDL-C	TOTAL-C	HDL-C	TG	APO-B
Placebo	88	0	+1	-1	+5	0
3.8 g (10 capsules)	95	-15*	-7*	+3*	+10	-12*
4.5 g (12 capsules)	94	-18*	-10*	+3	+9	-12*

*p<0.05 for lipid parameters compared to placebo, for Apo B compared to baseline

LDL-C, total-C, and Apo B are mean values; HDL-C and TG are median values.

In a study in 98 patients with LDL-C between 145 and 250 mg/dL (mean 169 mg/dL), Welchol™ 3.8 g was given for 6 weeks as a single dose with breakfast, a single dose with dinner, or as divided doses with breakfast and dinner. The mean LDL-C reductions were 18%, 15%, and 18% for the three dosing regimens, respectively. The reductions with these three regimens were not statistically different from one another.

Co-administration of Welchol™ and an HMG-CoA reductase inhibitor (atorvastatin, lovastatin, or simvastatin) demonstrated an additive reduction of LDL-C in three clinical studies. As demonstrated in Table 2 below, Welchol™ doses of 2.3 g to 3.8 g resulted in additional 8% to 16% reductions in LDL-C above that seen with the HMG-CoA reductase inhibitor alone.

**Table 2: Welchol™ in Combination with Atorvastatin, Simvastatin, and Lovastatin
–Percentage Change in Lipid Parameters**

DOSE/DAY	N	LDL-C	TOTAL-C	HDL-C	TG	APO-B
Atorvastatin Trial (4-week)						
Placebo	19	+3	+4	+4	+10	–2
Atorvastatin 10 mg	18	–38*	–27*	+8	–24*	–32*
Welchol™ 3.8 g/ Atorvastatin 10 mg	18	–48*	–31*	+11	–1	–38*
Atorvastatin 80 mg	20	–53*	–39*	+6	–33*	–46*
Simvastatin Trial (6-week)						
Placebo	33	–4	–2	–3	+6	–4*
Simvastatin 10 mg	35	–26*	–19*	+3*	–17*	–20*
Welchol™ 3.8 g/ Simvastatin 10 mg	34	–42*	–28*	+10*	–12*	–33*
Simvastatin 20 mg	39	–34*	–23*	+7*	–12*	–26*
Welchol™ 2.3 g/ Simvastatin 20 mg	37	–42*	–29*	+4*	–12*	–32*
Lovastatin Trial (4-week)						
Placebo	26	0	+1	+1	+1	0
Lovastatin 10 mg	26	–22*	–14*	+5	0	–16*
Welchol™ 2.3 g/ Lovastatin 10 mg together	27	–34*	–21*	+4	–1	–24*
Welchol™ 2.3 g/ Lovastatin 10 mg apart	23	–32*	–21*	+2	–2	–24*

*p<0.05 for lipid parameters compared to placebo, for Apo B compared to baseline

LDL-C, total-C, and Apo B are mean values; HDL-C and TG are median values.

In all three studies, the LDL-C reduction achieved with the combination of Welchol™ and any given dose of HMG-CoA reductase inhibitor therapy was statistically superior to that achieved with Welchol™ or that dose of the HMG-CoA reductase inhibitor alone.

The LDL-C reduction with atorvastatin 80 mg was not statistically significantly different from the combination of Welchol™ 3.8 g and atorvastatin 10 mg.

INDICATIONS AND USAGE

Welchol™, administered alone or in combination with an HMG-CoA reductase inhibitor, is indicated as adjunctive therapy to diet and exercise for the reduction of elevated LDL cholesterol in patients with primary hypercholesterolemia (Fredrickson Type IIa).

Therapy with lipid lowering agents should be a component of multiple risk-factor intervention in patients at significant increased risk for atherosclerotic vascular disease due to hypercholesterolemia. Lipid altering agents should be used in addition to a diet restricted in saturated fat and cholesterol and when the response to diet and other non-pharmacological means has been inadequate.

Prior to initiating therapy with Welchol™, secondary causes of hypercholesterolemia (i.e., poorly controlled diabetes mellitus, hypothyroidism, nephrotic syndrome, dysproteinemias, obstructive liver disease, other drug therapy, alcoholism) should be excluded, and a lipid profile obtained to assess total-C, HDL-C, and TG. For individuals with TG less than 400 mg/dL, LDL-C can be estimated using the following equation.³

$$\text{LDL-C} = \text{Total-C} - [(\text{TG}/5) + \text{HDL-C}]$$

Periodic determination of serum cholesterol levels in patients as outlined in the National Cholesterol Education Program (NCEP) guidelines should be done to confirm a favorable initial and long-term response. The NCEP treatment guidelines are presented in Table 3.

Table 3: NCEP Guideline

PATIENT ASSESSMENT CRITERIA	LDL-C	
	INITIATION LEVEL	MINIMUM GOAL
Without CHD and with fewer than two risk factors	≥ 190 mg/dL	< 160 mg/dL
Without CHD and with two or more risk factors	≥ 160 mg/dL	< 130 mg/dL
With CHD	≥ 130 mg/dL	≤ 100 mg/dL

- CHD = Coronary Heart Disease
- 1. Other risk factors for CHD include the following: age (males >45 years, females >55 years or premature menopause without estrogen replacement therapy); family history of premature CHD; current cigarette smoking; hypertension; confirmed HDL-C, <35mg/dL (<0.01 mmol/L); and diabetes mellitus. Subtract risk factor if HDL-C >60 mg/dL (>1.6 mmol/L).
- 2. In CHD patients with LDL-C levels of 100-129 mg/dL, the physician should exercise clinical judgment in deciding whether to initiate drug treatment.

CONTRAINDICATIONS

Welchol™ is contraindicated in individuals with bowel obstruction and in individuals who have shown hypersensitivity to any of the components of Welchol™.

PRECAUTIONS

General

Patients with TG levels greater than 300 mg/dL were excluded from Welchol™ clinical trials. Caution should be exercised when treating patients with TG levels greater than 300 mg/dL.

In non-clinical safety studies, rats administered colestevlam at doses greater than 30-fold the projected human clinical dose experienced hemorrhage from vitamin K deficiency. Welchol™ did not induce any clinically significant reduction in the absorption of vitamins A, D, E, or K during clinical trials of up to one year. However, caution should be exercised when treating patients with a susceptibility to vitamin K or fat soluble vitamin deficiencies.

The safety and efficacy of Welchol™ in patients with dysphagia, swallowing disorders, severe gastrointestinal motility disorders, or major gastrointestinal tract surgery have not been established. Consequently, caution should be exercised when Welchol™ is used in patients with these gastrointestinal disorders.

Information for the Patient

Welchol™ may be taken once per day with a meal, or taken twice per day in divided doses with meals. Patients should be directed to take Welchol™ with a liquid and a meal, and adhere to their NCEP-recommended diet. Patients should tell their physicians if they are pregnant, are intending to become pregnant, or are breastfeeding.

Laboratory Tests

Serum total-C, LDL-C and TG levels should be determined periodically based on NCEP guidelines to confirm favorable initial and adequate long-term responses.

Drug Interactions

Welchol™ has been studied in several human drug interaction studies in which it was administered with a meal and the test drug. Welchol™ was found to have no significant effect on the bioavailability of digoxin, lovastatin, metoprolol, quinidine, valproic acid, and warfarin. Welchol™ decreased the C_{max} and AUC of sustained-release verapamil (Calan SR®) by approximately 31% and 11%, respectively. Since there is a high degree of variability in the bioavailability of verapamil, the clinical significance of this finding is

unclear. In clinical studies, co-administration of Welchol™ with atorvastatin, lovastatin, or simvastatin did not interfere with the lipid-lowering activity of the HMG-CoA reductase inhibitor. Other drugs have not been studied. When administering other drugs for which alterations in blood levels could have a clinically significant effect on safety or efficacy, physicians should consider monitoring drug levels or effects.

Carcinogenesis, Mutagenesis, Impairment of Fertility

A 104-week carcinogenicity study with colesevelam (Welchol™) was conducted in CD-1 mice, at oral dietary doses up to 3 g/kg/day. This dose was approximately 50 times the maximum recommended human dose of 4.5 g/day, based on body weight, mg/kg. There were no significant drug-induced tumor findings in male or female mice. In a 104-week carcinogenicity study with colesevelam (Welchol™) in Harlan Sprague-Dawley rats, a statistically significant increase in the incidence of pancreatic acinar cell adenoma was seen in male rats at doses >1.2 g/kg/day (approximately 20 times the maximum human dose, based on body weight, mg/kg) (trend test only). A statistically significant increase in thyroid C-cell adenoma was seen in female rats at 2.4 g/kg/day (approximately 40 times the maximum human dose, based on body weight, mg/kg).

Colesevelam and four degradants present in the drug substance have been evaluated for mutagenicity in the Ames test and a mammalian chromosomal aberration test. The four degradants and an extract of the parent compound did not exhibit genetic toxicity in an *in vitro* bacterial mutagenesis assay in *S. typhimurium* and *E. coli* (Ames assay) with or without rat liver metabolic activation. An extract of the parent compound was positive in the Chinese Hamster Ovary (CHO) cell chromosomal aberration assay in the presence of metabolic activation and negative in the absence of metabolic activation. The results of the CHO cell chromosomal aberration assay with two of the four degradants, decylamine HCl and aminohexyltrimethyl ammonium chloride HCl, were equivocal in the absence of metabolic activation and negative in the presence of metabolic activation. The other two degradants, didecylamine HCl and 6-decylamino-hexyltrimethyl ammonium chloride HCl, were negative in the presence and absence of metabolic activation.

Colesevelam did not impair fertility in rats at doses of up to 3 g/kg/day (approximately 50 times the maximum human dose, based on body weight, mg/kg).

PREGNANCY

Pregnancy Category B

Reproduction studies have been performed in rats and rabbits at doses up to 3 g/kg/day and 1 g/kg/day, respectively (approximately 50 and 17 times the maximum human dose, based on body weight, mg/kg) and have revealed no evidence of harm to the fetus due to colesevelam. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Requirements for vitamins and other nutrients are increased in pregnancy. The effect of Welchol™ on the absorption of vitamins has not been studied in pregnant women.

Pediatric Use

The safety and efficacy of colesevelam (Welchol™) have not been established in pediatric patients.

Geriatric Use

There is no evidence for special considerations when colesevelam (Welchol™) is administered to elderly patients.

ADVERSE REACTIONS

Welchol™ treatment-emergent adverse events that occurred in greater than 2% of patients in an integrated safety analysis are presented in Table 4.

Table 4: Frequent (>2%) Treatment-Emergent Adverse Events By Treatment Category

BODY SYSTEM/ ADVERSE EVENT	PLACEBO (N=258) %	WELCHOL™ ONLY (N=807) %
Body as a Whole		
Infection	13	10
Headache	8	6
Pain	7	5
Back Pain	6	3
Abdominal Pain	5	5
Flu Syndrome	3	3
Accidental Injury	3	4
Asthenia	2	4
Digestive System		
Flatulence	14	12
Constipation	7	11
Diarrhea	7	5
Nausea	4	4
Dyspepsia	3	8
Respiratory System		
Sinusitis	4	2
Rhinitis	3	3
Cough Increased	2	2
Pharyngitis	2	3
Musculoskeletal System		
Myalgia	0	2

OVERDOSAGE

Because Welchol™ is not absorbed, the risk of systemic toxicity is low. Doses in excess of 4.5 g per day have not been tested.

DOSAGE AND ADMINISTRATION

Monotherapy

The recommended starting dose of Welchol™ is 5 capsules taken twice per day with meals or 10 capsules once per day with a meal. The Welchol™ dose can be increased to 12 capsules, depending upon the desired therapeutic effect. Welchol™ should be taken with a liquid.

Combination Therapy

Welchol™, at doses of 6 to 10 capsules per day, has been shown to be safe and effective when dosed at the same time (i.e., co-administered) as an HMG-CoA reductase inhibitor or when the two drugs are dosed apart. [CLINICAL PHARMACOLOGY, Clinical Trials]. Welchol™ should be taken with a liquid. For maximal therapeutic effect in combination with an HMG-CoA reductase inhibitor, the recommended dose of Welchol™ is 5 capsules taken twice per day with meals or 10 capsules taken once per day with a meal.

HOW SUPPLIED

Welchol™ is supplied as a white, imprinted, opaque, hard-gelatin capsule containing 375 mg colesevelam hydrochloride and 1% magnesium stearate.

Welchol™ capsules are available as follows:

Bottles of 300—NDC xxxx-xxxx-xx

Storage

Store at room temperature (25 °C). Brief exposure to 40 °C does not adversely affect the product. [See USP controlled room temperature.] Protect from moisture.
